

## Title: /stepper - Invalid char validation is not working

Priority: medium

Environment: PROD ??

### Description:

Chrome v.114

Reproduction:

1. Open **/stepper** site
2. Add some invalid char to name/address step's input (ex. /\*-+!@#\$%^&\*()\_~`<>? )
3. Go to the last step

+ **correct behaviour:**

After typing some invalid char under input, there should be an error message -something like that:

The maximum length for this field is 20 characters.

**Next**

You mustn't go to the next step

- **actual behaviour:**

There is no any error message

You can go to the next step

You can finish that form and save data with invalid char

Attached is a video of this bug.
